

Page Builder Pro

Page Builder Pro adalah aplikasi web page builder dengan fitur drag-and-drop yang memungkinkan Anda membuat halaman web tanpa perlu coding. Aplikasi ini dibangun dengan PHP, MySQL, dan JavaScript modern.

✨ Fitur Utama

Drag & Drop Editor

- Interface intuitif untuk membangun halaman
- Real-time preview saat editing
- Element library yang lengkap
- Property panel untuk customization

Element Types

- **Text & Heading** - Teks dan heading dengan styling
- **Image** - Upload dan manage gambar
- **Button** - Tombol dengan link dan styling
- **Container** - Layout containers dan rows
- **Video** - Embed video dengan controls
- **Form** - Form elements dengan validation
- **Spacer** - Spacing elements

Page Management

- Multiple projects support
- Page versioning dan history

- SEO meta tags support
- Custom CSS dan JavaScript injection
- Publish/unpublish functionality

Template System

- Pre-built templates
- Template library dengan preview
- Export/import templates
- Template usage tracking

Asset Management

- File upload dengan validation
- Image thumbnail generation
- Asset organization per project
- Multiple file type support

User Management

- Role-based access control (Admin, Editor, Viewer)
- User permissions management
- Secure authentication system

Teknologi

- **Backend:** PHP 7.4+ dengan PDO
- **Database:** MySQL/MariaDB
- **Frontend:** HTML5, CSS3, JavaScript ES6+
- **CSS Framework:** Custom CSS dengan Flexbox/Grid
- **Icons:** Font Awesome 6

- **Architecture:** MVC Pattern

Requirement

Server Requirements

- PHP 7.4 atau lebih tinggi
- MySQL 5.7+ atau MariaDB 10.2+
- Apache/Nginx web server
- mod_rewrite enabled (untuk Apache)

PHP Extensions

- PDO
- PDO MySQL
- JSON
- GD (untuk image processing)
- File uploads enabled

Instalasi

1. Download & Extract

```
# Clone atau download source code
git clone [repository-url]
cd page_builder
```

2. Set Permissions

```
chmod 755 assets/uploads/  
chmod 644 .htaccess
```

3. Database Setup

Jalankan installer dengan mengakses:

```
http://your-domain.com/install.php
```

Installer akan memandu Anda melalui:

1. System requirements check
2. Database configuration
3. Schema installation
4. Admin user creation

4. Security

Setelah instalasi selesai:

- Hapus file `install.php`
- Pastikan folder `includes/` dan `classes/` tidak dapat diakses public
- Konfigurasi SSL/HTTPS untuk production

Struktur Project

```

└─ 404.php	# 404 error page

Penggunaan

Login ke Admin Panel

1. Akses `/admin/login.php`
2. Login dengan akun admin yang dibuat saat instalasi

Membuat Project Baru

1. Dari dashboard, klik "New Project"
2. Isi nama dan deskripsi project
3. Set domain jika diperlukan

Membuat Halaman

1. Pilih project
2. Klik "New Page"
3. Masuk ke drag & drop editor
4. Drag elements dari library ke canvas
5. Customize properties di panel kanan
6. Save dan publish

Menggunakan Templates

1. Buka template library
2. Preview template yang tersedia
3. Apply ke halaman baru
4. Customize sesuai kebutuhan

Konfigurasi

Database Configuration

Edit `includes/config.php`:

```
define('DB_HOST', 'localhost');  
define('DB_NAME', 'page_builder');  
define('DB_USER', 'username');  
define('DB_PASS', 'password');
```

Upload Settings

```
define('MAX_FILE_SIZE', 5242880); // 5MB  
define('ALLOWED_FILE_TYPES', ['jpg', 'jpeg', 'png', 'gif', 'webp',  
'pdf']);
```

Security Settings

```
define('SESSION_LIFETIME', 7200); // 2 hours  
define('MAX_LOGIN_ATTEMPTS', 5);  
define('LOGIN_LOCKOUT_TIME', 300); // 5 minutes
```

Keamanan

Built-in Security Features

- Password hashing dengan PHP `password_hash()`
- SQL injection protection dengan prepared statements

- XSS protection dengan input sanitization
- CSRF protection untuk forms
- File upload validation
- Session security dengan httponly cookies
- Rate limiting untuk login attempts

Security Headers

Aplikasi menyertakan security headers:

- X-Frame-Options
- X-Content-Type-Options
- X-XSS-Protection
- Content Security Policy (optional)

API Endpoints

Pages API

GET	/api/pages.php?action=list	# List pages
GET	/api/pages.php?action=get&id=1	# Get page
POST	/api/pages.php	# Save/create page

Elements API

GET	/api/elements.php	# List element types
GET	/api/elements.php?action=get_default&type=text	# Get default element
POST	/api/elements.php	# Create/update element

Properties API

GET	/api/properties.php?type=text	# Get element properties
POST	/api/properties.php	# Validate properties

Customization

Adding Custom Elements

1. Tambah element type di database
2. Update `Element.php` class
3. Tambah rendering logic
4. Update JavaScript handler

Custom Styling

- Edit `assets/css/admin.css` untuk admin panel
- Tambah custom CSS di halaman melalui editor
- Modify default element styles

Custom JavaScript

- Edit `assets/js/admin.js` untuk editor functionality
- Tambah custom JS di halaman melalui editor

Backup & Restore

Database Backup

```
mysqldump -u username -p page_builder > backup.sql
```

File Backup

Backup folder berikut:

- `assets/uploads/` - User uploaded files
- `includes/config.php` - Configuration

Restore

```
mysql -u username -p page_builder < backup.sql
```

Troubleshooting

Common Issues

1. Upload errors

- Check file permissions pada `assets/uploads/`
- Verify `MAX_FILE_SIZE` setting
- Check PHP `upload_max_filesize`

2. Database connection errors

- Verify database credentials
- Check if database exists
- Ensure MySQL/MariaDB is running

3. .htaccess issues

- Ensure `mod_rewrite` is enabled

- Check file permissions
- Verify RewriteBase setting

4. JavaScript errors

- Check browser console
- Verify file paths
- Clear browser cache

Debug Mode

Enable debug mode in `config.php`:

```
define('DEBUG_MODE', true);
```

Changelog

Version 1.0.0

- Initial release
- Drag & drop editor
- Basic element types
- User management
- Template system
- Asset management
